

CRIMEGRAPH SOP

STANDARD OPERATING PROCEDURE

SYSTEM VERSION: v1.1.0 (Stable Release)

SYSTEM ARCHITECTURE: OFFLINE-FIRST, ZERO-CLOUD, DEVICE-LOCAL SQLite

COMPLIANCE: CPIA (Criminal Procedure and Investigations Act 1996) Ready

1. SYSTEM ACCESS & BIOMETRICS

CrimeGraph is a highly restricted, encrypted environment. Security protocols must not be bypassed under any circumstances.

- **Authentication:** The application requires native device biometrics (Fingerprint / FaceID) to unlock.
- **Fallback Mechanism:** If biometrics fail or are unavailable, operators must input the device's secure master PIN.
- **Session Timeout:** The application will automatically drop back to the biometric lock screen immediately if left idle or pushed to the background OS level.

2. CASE MANAGEMENT & CPIA COMPLIANCE

All operational intelligence must be housed within a properly designated Case File to ensure strict disclosure compliance and maintain the chain of evidence for the Crown Prosecution Service (CPS).

- **Case Creation:** Tap **NEW OPERATION**. Provide a valid Crime Reference Number (CRN) or URN, an Operation Title, and a Classification Level.
- **Audit Logging:** Every action taken (node creation, relationships, notes, export, deletion) is immutably recorded in the background Audit Ledger in compliance with CPIA guidelines.

3. TACTICAL MAPPING & METADATA (POLE MODEL)

The Graph Workspace serves as the primary analytical environment, enforcing the UK law enforcement POLE data model (Person, Object, Location, Event).

- **Adding Nodes & Custom Fields:** Tap the blue **+** button. Select the entity type and assign a confidence rating (1-5 stars). Use the **Custom Fields** section to define specific intelligence identifiers (e.g., 'Alias', 'Vehicle Registration', 'DOB').
- **Drawing Connections:** Tap the source node, select **Draw Connection**, tap the target node, and define the relationship.
- **Decluttering:** Use the red **FILTERS** button to temporarily hide specific entity types to clarify complex network visualisations.

4. NARRATIVE INTELLIGENCE LOGS (NEW IN v1.1)

Analysts can now record comprehensive operational notes directly within the workspace.

- **Drafting Reports:** Tap the orange **LOG** button in the workspace header to open the Intelligence Log panel.
- **Entity Tagging:** While drafting a report, tap any of the listed graph entities beneath the text box to structurally link the note to those specific nodes.
- **Reviewing Logs:** Tapping an individual node to open its Inspector panel will automatically display all Intelligence Logs tagged to that entity.

5. SECURE INTELLIGENCE SHARING

CrimeGraph utilises military-grade AES-GCM cryptography for secure intelligence transfer.

- **Exporting/Importing:** Tap **EXPORT** to generate an encrypted **.enc** intelligence package using a one-time password. Import packages via the **IMPORT** button on the dashboard using the established password.

6. EMERGENCY PROTOCOLS: THE KILL SWITCH

In the event of physical device compromise or a direct directive from a Senior Investigating Officer (SIO) to sanitise hardware, navigate to the [Settings/Admin](#) tab and engage the red **WIPE ALL DATA** button. This initiates a mathematically irreversible SQLite destruction protocol.
